

EIMT™

Extracorporeal Incontinence Magnetic Therapy

PCK EIMT™ is a new device for the treatment of women incontinence. The device works extracorporeally by using pulsed magnetic stimulation in the pelvic floor muscles.

EIMT™ is an easy-use, non-invasive and painless equipment that is used for stimulating pelvic floor muscles with a time-varying magnetic field generated. There is no part in **EIMT™** touching to the skin of the patient in the treatment. The patient simply sits on the **EIMT™** chair with normal daily clothes during the treatment session. The created magnetic field causes contraction and relaxation of the pelvic floor muscles in each excitation period. This continued action is a good exercise to rebuild the strength and endurance of the pelvic floor muscles to help regain the bladder control.

EIMT™ has no side effects and indicated for the women at all ages. The device can be used effectively in stress incontinence, urge incontinence and overflow incontinence difficulties.

The device consists of a magnetic field control unit and a treatment chair. The strong magnetic field generated by the control unit is focussed to the pelvic floor muscle group by the treatment chair. Focused magnetic field causes muscle stimulation in the pelvic area. **EIMT™** works the muscles in this area in a higher frequency than the patient normally could do. In a normal application series, weekly 15-minute treatment sessions are given between 6 to 8 weeks. It is an ideal device not only for the hospitals but also for the doctor offices because of its easy treatment method and effective results.
